

## Should Students Get Limited Access to the Internet? - Trisha Jc1F

The internet plays a crucial role in education today, offering students infinite information, knowledge and tools to succeed academically. However, giving students unlimited access to the internet can put them at risk for distractions and dangerous content. Many question whether students should get limited access to the internet. Some believe although there are many advantages to the internet, boundaries should be set in order for students to be protected when using it for educational purposes.

To begin with, the internet is one of the best sources to find and obtain current information that isn't found in general textbooks. For subjects or topics that contain constantly changing contents, such as science, this can be particularly crucial. Additionally, studies have shown that students who use technology in the classroom are more attentive to teachers and receive back higher scores. Limiting internet access can also disable students, particularly from low-income families that are unable to afford and enroll into a school, from gaining new knowledge. This is disadvantageous as it makes them incapable of keeping up academically.

However, the internet can also be a dangerous place if not used correctly. Curious students may have uncontrollable urges to surf inappropriate, violent websites on the internet which further damages their developing, fragile minds. Additionally, students may abuse the internet to carry out cyberbullying or doxxing, an excessive sharing of private information online, to put others down. Unfair internet usage can also allow students to cheat or hack into websites.

Even though the internet is a crucial tool to help students academically, schools and parents should establish a safer environment that will encourage children to not get distracted by setting necessary and appropriate limits on how students surf the net.
